

CHEMICAL EQUILIBRIA

Reactions:

• going to completion – reaction continues until one of the reactants is completely used up, e.g.

reversible - reaction going both directions

reactants ↔ products

 $Ca(HCO_3)_2 \rightarrow CaCO_3 + \dots + \dots$

 $CH_3COOH + H_2O \rightarrow \dots + \dots$

 \leftrightarrow reversible reaction \rightarrow forward reaction \leftarrow backward reaction

Chemical equilibrium = the state of a reaction system of a reversible reaction where the forward and the backward reaction occur at the same rate.

1. What can you tell about the concentrations of reactants and products in an equilibrium mixture?

This kind of equilibrium is called **dynamic equilibrium**. It means that however the concentrations of reactants and products it does not mean that there are no reactions proceeding. They occur but the forward and the backward reaction occur at

The equilibrium constant, K_c

a A + b B \leftrightarrow c C + d D ... reversible reaction rate of the forward reaction: $v_1 = k_1 \times [A]^a \times [B]^b$ rate of the backward reaction: $v_2 = k_2 \times [C]^c \times [D]^d$

At equilibrium: $v_1 = v_2$

$$k_1 \times [A]^a \times [B]^b = k_2 \times [C]^c \times [D]^d \qquad \frac{k_1}{k_2} = \frac{[C]^c \times [D]^d}{[A]^a \times [B]^b} \qquad \mathcal{K}_c = \frac{[C]^c \times [D]^d}{[A]^a \times [B]^b} = \text{Guldberg} - \text{Waage expression}$$

 K_{c} , equilibrium constant, depends on the temperature and pressure

Reactions involving solids:

Concentration of molecules within any solid is constant, it does not affect the equilibrium, chemists do not include the concentrations of any solid reactants or products in the equilibrium constant expression.

Reactions involving aqueous solutions:

Concentration of water is very high in dilute solutions, it is not changed during a reaction, chemists do not include the concentrations of water in the equilibrium constant expression.

- 2. Derive an expression for the equilibrium constant, K_c for the reaction:
 - a. 2 SO₂(g) + O₂(g) \leftrightarrow 2 SO₃(g)
 - b. $2 HI(g) \leftrightarrow H_2(g) + I_2(g)$
 - c. $4 PF_5(g) \leftrightarrow P_4(g) + 10 F_2(g)$
 - d. $H_2(g) + Br_2(g) \leftrightarrow 2 HBr(g)$

TENTO PROJEKT JE SPOLUFINANCOVÁN EVROPSKÝM SOCIÁLNÍM FONDEM A STÁTNÍM ROZPOČTEM ČESKÉ REPUBLIKY

VESTICE DO ROZVOJE VZDĚLÁVÁNÍ

- e. $CH_3COOH(aq) + H_2O(I) \leftrightarrow CH_3COO^{-}(aq) + H_3O^{+}(aq)$
- $f. \quad (NH_4)_2 CO_3(s) \leftrightarrow CO_2(g) + 2 NH_3(g) + H_2O(g)$
- 3. The same equilibrium system may be represented by two different equations:

 $N_2(g) + O_2(g) \leftrightarrow 2 \ NO(g)$

 $2 \ NO(g) \leftrightarrow N_2(g) + O_2(g)$

- a. Write expressions for two equilibrium constants, K_c and K_c .
- b. What is the mathematical relation between K_c and K_c ?
- 4. The equilibrium between SO₃, SO₂ and O₂ may be represented equally well by two different equations:

$$2 \text{ SO}_2(g) + \text{O}_2(g) \leftrightarrow 2 \text{ SO}_3(g) \qquad K_c$$

 $SO_2(g) + \frac{1}{2} O_2(g) \leftrightarrow SO_3(g) \qquad K_c$

- a. Write expressions for two equilibrium constants, K_c and K_c .
- b. At 852 K K_c= 1.28×10^4 mol·dm⁻³ and at 1000 K K_c = 2.8×10^2 mol·dm⁻³. What are the values of K_c' at these temperatures?
- *c.* What are the values of the equilibrium constants of the reaction 2 SO₃(g) \leftrightarrow 2 SO₂(g) + O₂(g) at both above mentioned temperatures?
- 5. What can you say about the relative concentrations of reactants and products when:
 - a. K_c is very large
 - b. K_c is very small
- 6. $N_2(g) + O_2(g) \leftrightarrow 2NO(g)$ equilibrium at 1500 K:

 $[N_2(g)] = 10^{-2} \text{ mol} \cdot dm^{-3}$

 $[O_2(g)] = 10^{-1} \text{ mol} \cdot dm^{-3}$

 $[NO(g)] = 10^{-4} mol \cdot dm^{-3},$

calculate the value of the equilibrium constant at this temperature.

 (10^{-5})

7. Calculate K_c for the equilibrium $H_2(g) + I_2(g) \leftrightarrow 2 HI(g)$ at 350°C if the equilibrium mixture contains $[H_2(g)] = 0.2 \text{ mol} \cdot dm^{-3}$, $[I_2(g)] = 0.02 \text{ mol} \cdot dm^{-3}$ and $[HI(g)] = 0.59 \text{ mol} \cdot dm^{-3}$.

(87)

8. A sealed container (V = 2 dm³) contains at 1400 K an equilibrium mixture of 0.002 mol of $S_2(g)$, 0.06 mol of $H_2(g)$ and 0.04 mol of $H_2S(g)$. Calculate the equilibrium constant for the reaction 2 $H_2S(g) \leftrightarrow 2 H_2(g) + S_2(g)$ at this temperature.

 $(2.25 \text{ mol} \cdot \text{dm}^{-3})$

The equilibrium constant for the reaction PCl₅ (g) ↔ PCl₃(g) + Cl₂(g) at the temperature of 250°C is 0.19 mol·dm⁻³. An equilibrium mixture contains [PCl₅(g)] = 0.48 mol·dm⁻³ and [PCl₃(g)] = 0.22 mol·dm⁻³. Calculate the equilibrium concentration of chlorine.

 $(0.41 \text{ mol} \cdot \text{dm}^{-3})$

10. A vessel of the volume of 0.5 dm³ contains at 35°C an equilibrium mixture of 0.010 mol of CO(g), 0.012 mol of $Br_2(g)$ and $COBr_2(g)$. Calculate the mass of $COBr_2(g)$ in the equilibrium mixture knowing that $CO(g) + Br_2(g) \leftrightarrow COBr_2(g)$ has $K_C = 79 \text{ mol}^{-1} \cdot \text{dm}^3$ at such a temperature.

(3.56 g)

Factors affecting equilibria

- 11. What is the effect of:
 - a. change in concentrations
 - b. change in pressure
 - c. change in temperature
 - d. introducing a catalyst

on the following equilibrium: $N_2(g) + 3 H_2(g) \leftrightarrow 2 NH_3(g)$?

Solution:

a. *p*, *t* stays the same, we add or remove reactants or products.

p, *t* stays the same, then $K_c = \frac{[NH_3]^2}{[N_2] \times [H_2]^3}$

 $\underline{N_2 \text{ is added}} \Rightarrow \text{the concentration of } N_2 \text{} \Rightarrow [NH_3] \text{}$

Equilibrium is shifted to the

 $\overline{\text{NH}_3}$ is added \Rightarrow the concentration of ammonia and so the concentrations of nitrogen and hydrogen must

Equilibrium is shifted to the

b. Pressure is changed \Rightarrow equilibrium constant

Pressure has an effect on equilibrium systems involving gases only.

 $N_2(g) + 3H_2(g) \leftrightarrow 2NH_3(g)$ moles of gases moles of a gas

<u>Higher pressure</u> – system tends to reach the *smallest/highest* possible volume and so the equilibrium is shifted towards *smaller/higher* number of moles of gases. Equilibrium is shifted to the

c. temperature is changed \Rightarrow equilibrium constant

 $N_2(g) + 3 H_2(g) \leftrightarrow 2 NH_3(g) \Delta H = -92 kJ \cdot mol^{-1}$

<u>Increased temperature</u> has the effect on the rate of both backward and forward reaction. However, it has a bigger effect on the reaction, which *needs/liberate* heat = *exothermic/ endothermic* reaction. In this case the forward reaction is *exothermic/endothermic* and the backward reaction is *exothermic/endothermic*. The *exothermic/endothermic* reaction will

 $\Delta H = 131 \text{ kJ} \cdot \text{mol}^{-1}$

 $\Delta H = -233.7 \text{ kJ} \cdot \text{mof}^{1}$ $\Delta H = 174 \text{ kJ} \cdot \text{mof}^{1}$

INVESTICE DO ROZVOJE VZDĚLÁVÁNÍ

be proceeding faster, so the equilibrium is shifted in the direction of the *forward/backward* reaction.

d. introducing a catalyst

A catalyst increases the rate of both the forward and the backward reaction \Rightarrow catalyst has no effect on the composition of an equilibrium mixture.

Le Chatelier's principle: "A system at equilibrium will react to oppose any change imposed on it."

- 12. State whether the forward or backward reaction is likely to take place when:
 - a. Hydrogen is removed
 - b. Ammonia is removed

from the equilibrium mixture described in the question 11.

- 13. What effect does an increase in temperature have on the position of equilibrium on:
 - a. $H_2O(g) + C(s) \leftrightarrow CO(g) + H_2(g)$
 - b. $2 H_2S(g) + SO_2(g) \leftrightarrow 3 S(s) + 2 H_2O(l)$
 - $c. \quad C(s) + CO_2(g) \leftrightarrow 2 \ CO(g)$
 - d. $AgClO_2(s) \leftrightarrow Ag(s) + \frac{1}{2} Cl_2(g) + O_2(g)$ $\Delta H = 0.0 \text{ kJ} \cdot mol^{-1}$
- 14. What is the effect of decreasing the pressure on:
 - a. $CaCO_3(s) \leftrightarrow CaO(s) + CO_2(g)$
 - $b. \quad N_2O_4(g) \leftrightarrow 2 \; NO_2(g)$
 - $c. \quad 2 \ \mathrm{SO}_2(g) + \mathrm{O}_2(g) \leftrightarrow 2 \ \mathrm{SO}_3(g)$
 - $d. \quad H_2 O(g) + C(s) \leftrightarrow CO(g) + H_2(g)$

15. What is the effect of increasing the pressure on:

- a. $3 \operatorname{Fe}(s) + 4 \operatorname{H}_2 O(g) \leftrightarrow \operatorname{Fe}_3 O_4(s) + 4 \operatorname{H}_2(g)$
- b. 2 $HI(g) \leftrightarrow H_2(g) + I_2(g)$
- $c. \quad S(s) + O_2(g) \leftrightarrow SO_2(g)$
- $d. \quad 2 \ CO_2(g) \leftrightarrow 2 \ CO(g) + O_2(g)$
- 16. In each of the following cases state the effect of a catalyst (if one is used) on the equilibrium system and the conditions of temperature and pressure which give the highest yield of products in the equilibrium mixture.

a.	Contact process	$2 \text{ SO}_2(g) + \text{O}_2(g) \leftrightarrow 2 \text{ SO}_3$	$\Delta H = -97 \ kJ \cdot morganity{morganization}^{1}$
b.	Haber process	$N_2(g)$ + 3 $H_2(g) \leftrightarrow$ 2 $NH_3(g)$	$\Delta H = -92 \ kJ \cdot moring ^{-1}$
C.	Bosch process	$H_2 O(g) + C(s) \leftrightarrow CO(g) + H_2(g)$	$\Delta H = 131 \ kJ \cdot mo\Gamma^1$
